Learn more about bulk updates

📍 Planning - Show map with current location on hover

Enable planners to see each driver's current location on the planboard by hovering over their current activity, showing city and street name derived from GPS coordinates.

What's included

- Display of each driver's current location on the planning board.
- Location information appears when you hover over a driver's current activity.

Benefits

- Planners can see where drivers are in near-real time to make informed planning decisions.

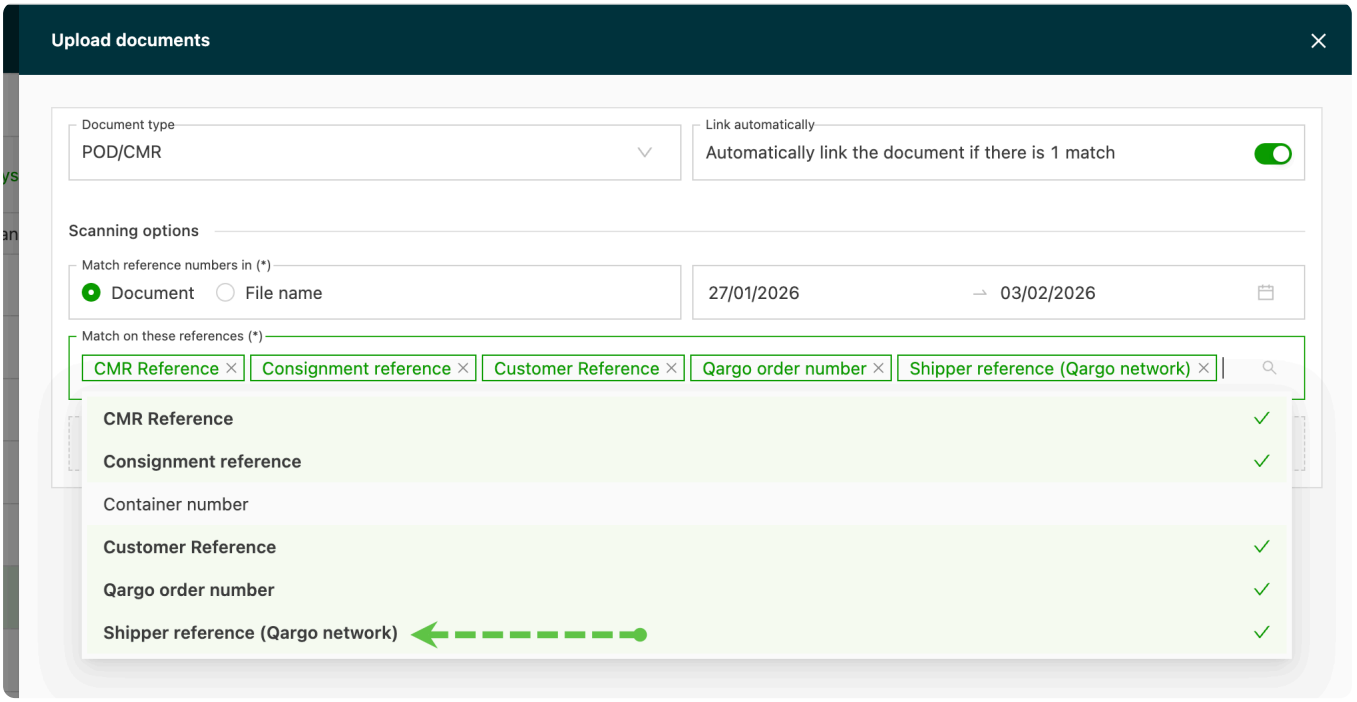

Limitations

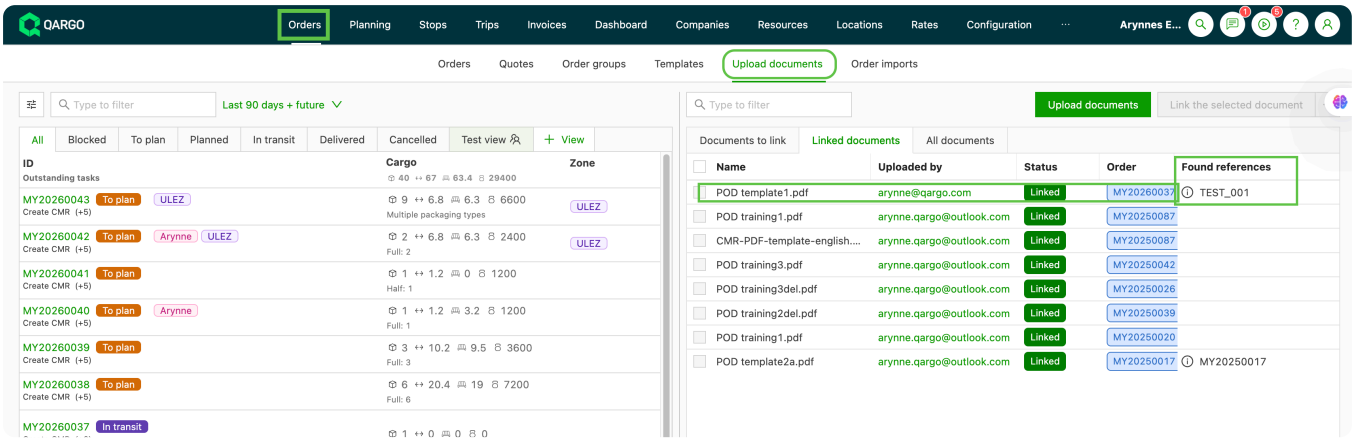

- Location updates refresh approximately every 3 minutes (not real-time) for some FMS integrations (Trimble).
- Depends on GPS data availability from the fleet integration.
- Update frequency may vary by telematics provider.

📑 Match CMR/POD by consignment shipper reference

It is possible to include the 'Shipper reference (Qargo network)' as a matched object, when using the upload document function.

- Qargo system will scan the uploaded document
- Based on the fields selected for matching, including the shipper reference, paperwork will be automatically linked to the order.
