Configure fields in Resources

Configure fields on resource profiles under Additional fields and resources. If default Qargo fields are not sufficient, add custom fields and select which resources they apply to. Leaving the field blank will set the custom field to show on all profiles.

Updated September 8, 2026

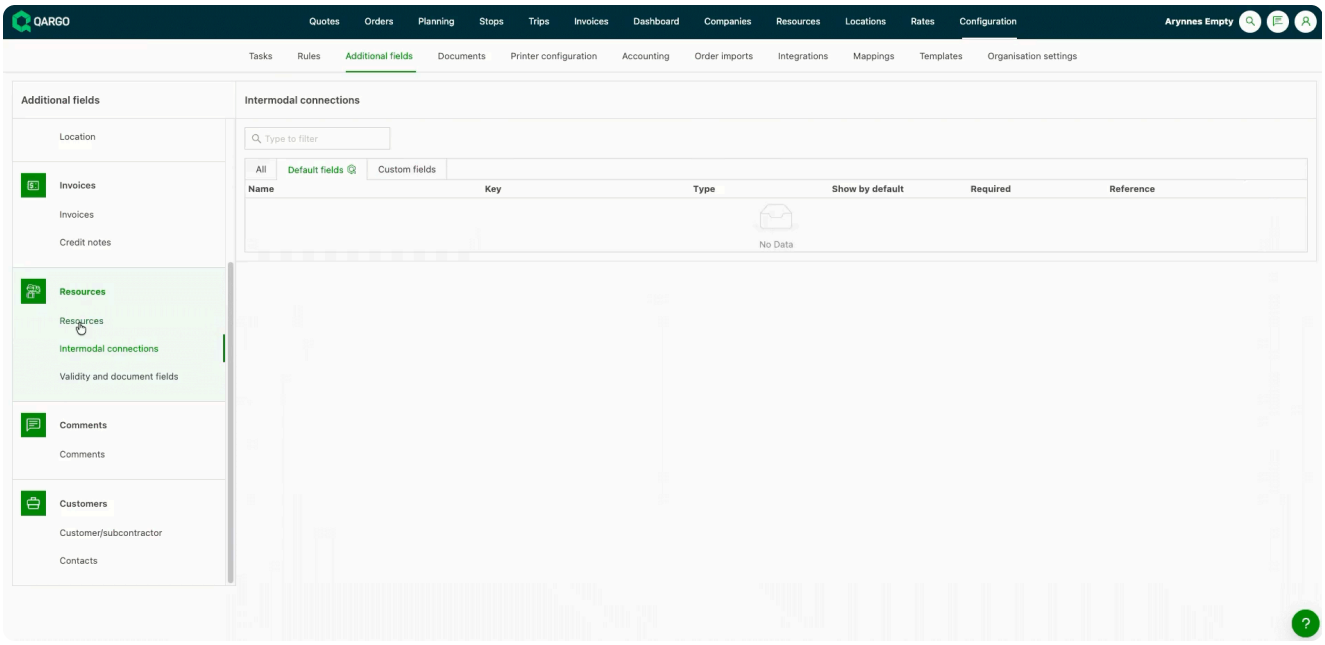

Qargo has default fields in all resource profiles. If needed, users can add or remove fields from the resource profile.

Configure additional fields on a resource profile

- Navigate to **Configuration > Additional fields**
- Select **'Resources'** in the left sidebar
  - Click on **'Intermodal connections'** to add or modify a field on an intermodal connection

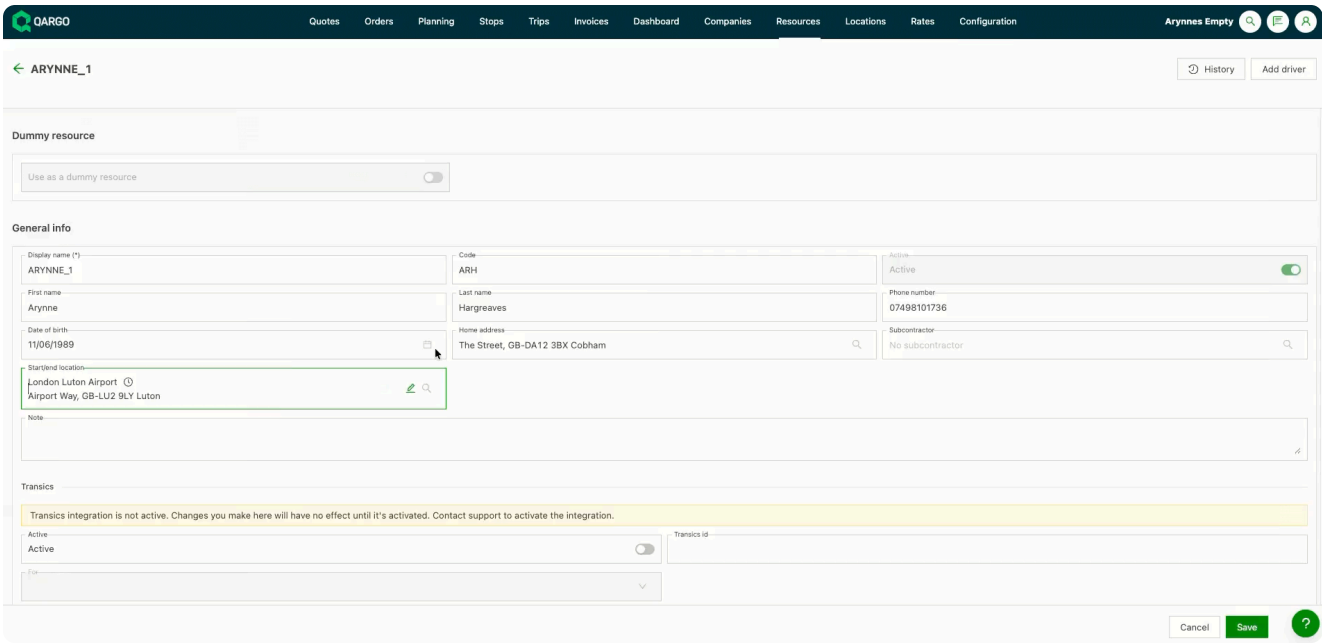

There are 2 tabs:

- **'Default fields'** show all the included Qargo fields. Fields highlighted in green are active on the profile. Fields in gray are available but must be activated to show in the resource profile.
  - Click on the pencil icon and set **'Active'** to make the field visible

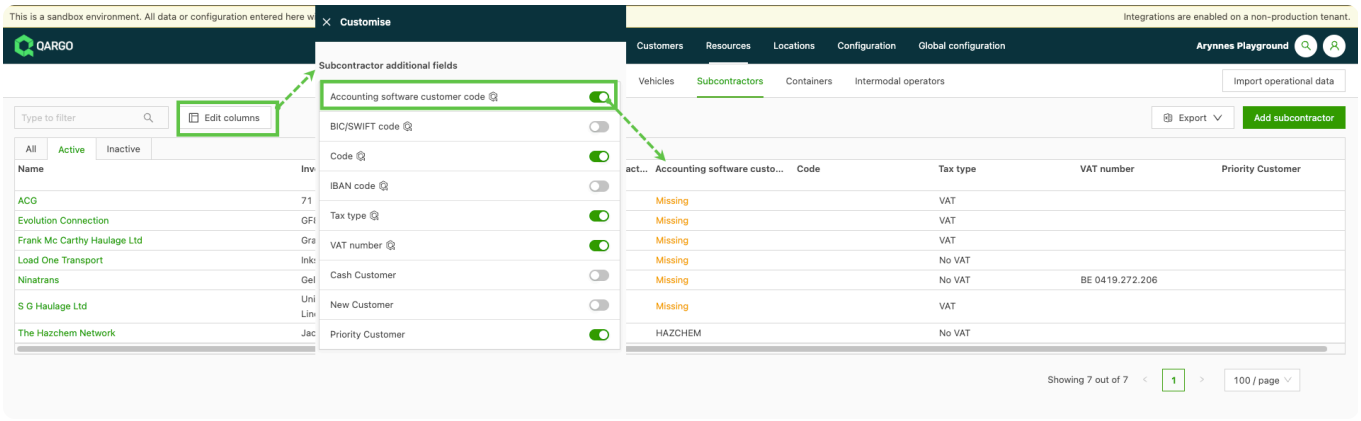

- **'Custom fields'** lets users manually add specific fields needed for resources. Fields can be enabled for specific resources.
  - Click **'Add custom field'**
  - Give the field a unique name (required)
  - Select the field type, using the option that best fits what is needed (required)
  - Select whether the field should **'always show'** and whether it is **'required'** (toggles)

- Add a description if needed (optional). This only shows to internal users
- Select which resource types the new fields apply to; multiple options can be selected. (Optional)

- Once the **'Default fields'** are set to Active or the **'Custom fields'** are created, they need to be toggled on in the **Customize** side menu on the specific resource tab.

🧰 Leave the **'Resource type'** blank to apply the new field to all resource profiles. The field will show in the **'Additional information'** section.
