Tracking: pallet barcodes & statuses

Updated October 6, 2025

Concept

- Palletline provides detailed status updates for the pallets that move through the network. These statuses are provided at the individual pallet level.
- The pallets themselves are identified with a barcode; each status update contains a barcode to indicate which pallet it belongs to.
- These barcodes are physically present on the pallets. The statuses may be generated when such a barcode is scanned with a physical barcode scanner, or by other means.

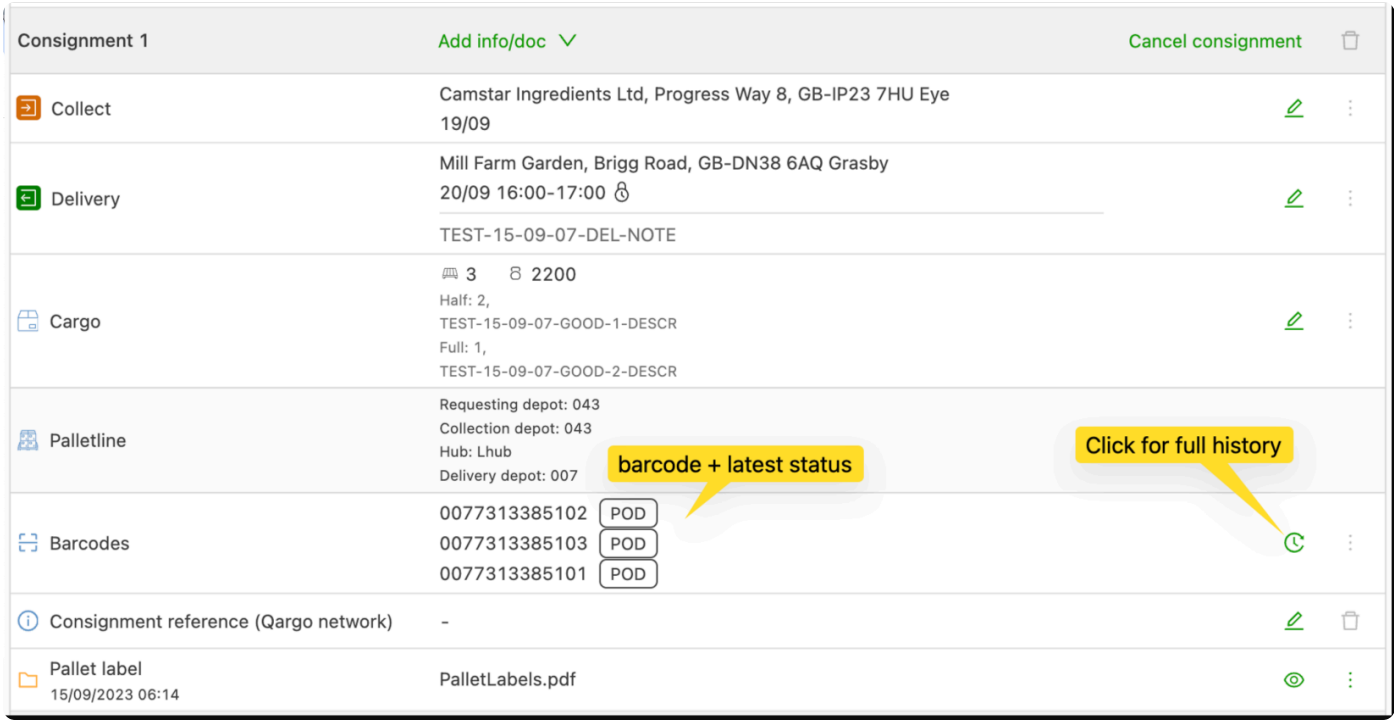

Implementation in Qargo

The barcodes assigned to the pallets are registered in Qargo, either when the shipment is exported to the Palletline system or when it is imported from there.

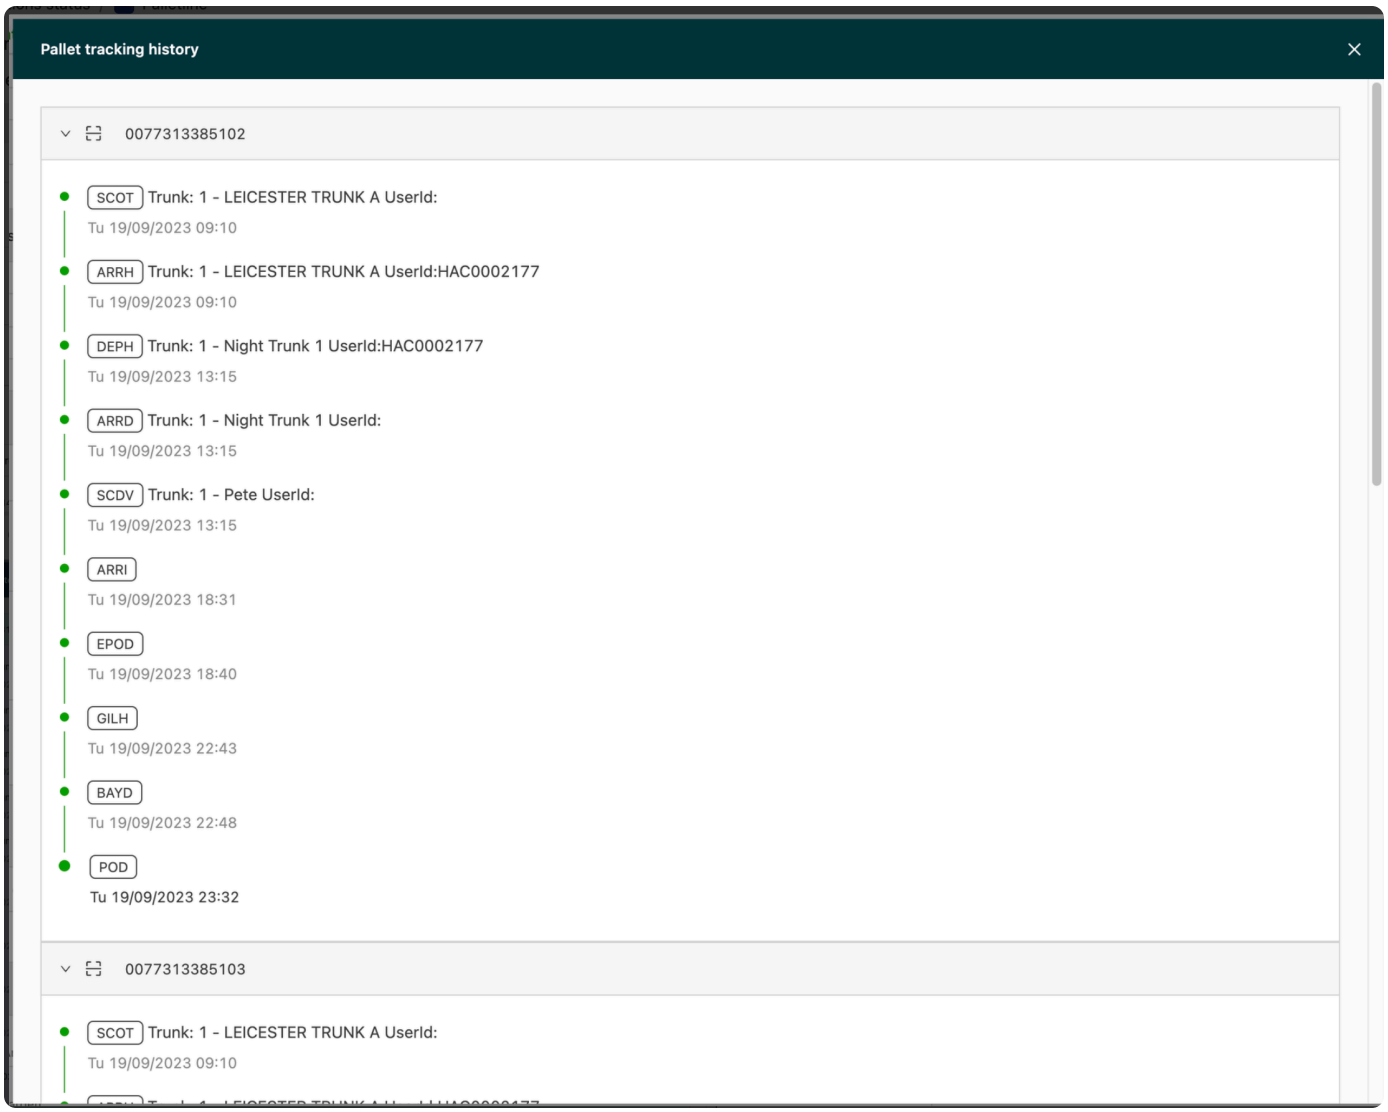

The barcodes may already be assigned earlier, when the labels are generated. However, they are not registered in Qargo until the shipment is actually exported.

The barcodes are displayed on the shipment together with the latest status update. The full history can be displayed as well.

Display of the barcodes in the shipment details section of the order details:

Full history of all pallet statuses, per pallet/barcode:
