PN – PalletForce: POD import/export

Updated March 20, 2025

- POD import happens for the pickup terminal use case
- POD export happens for the delivery terminal use case

POD import

PODs are periodically synced from the Palletforce API and stored in Qargo. POD imports are in either **JPEG** or **SVG** file format.

POD export

When a POD is created or uploaded in Qargo, the file is sent to Palletforce through the API. Uploaded files should be in **JPEG** file format.

Delivery images

The Palletforce API allows delivery images to be submitted and retrieved.

- Delivery images can be uploaded for shipments that the tenant receives from the pallet network. Supported file formats for uploads include **JPEG, PNG or TIFF.** Files in other formats (i.e., PDF) are uploaded as **JPEG**.
- Delivery images for shipments that the tenant sends to the pallet network are retrieved every ten minutes and are displayed alongside the shipment. Supported file formats are stored as **JPEG, PNG or TIFF**.

This feature must first be activated in the Palletforce system before it can be enabled in the Qargo account. The account manager can provide more details.
