Digital signatures (export only)

Updated October 24, 2024

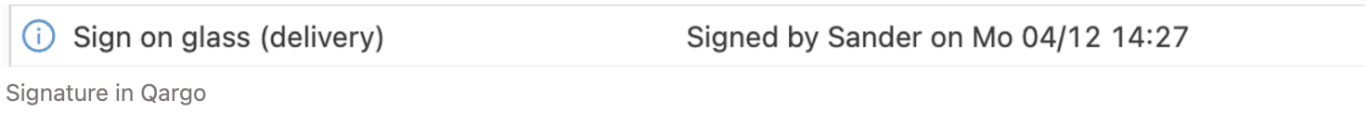

Concept

- A digital signature always complements a status that was uploaded earlier.
- In Palletline terms, this is called DSC (digital signature capture).
- The network also requests coordinates. These can be used when there are disputes about whether the pallets were delivered to the correct location.

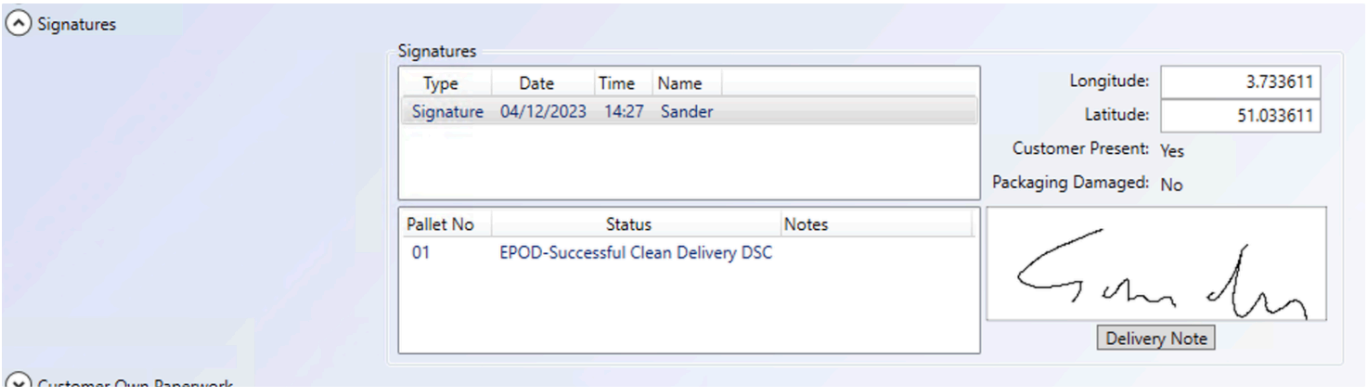

Implementation in Qargo

The signatures that are collected (e.g., on delivery in the mobile application) are exported to Contrado.

As a result, the signature can be viewed in Contrado, and a delivery receipt is generated, which is imported into Qargo via the POD sync.
