Multiple terminals

Updated October 24, 2024

Concept

In the Palletline system, each physical terminal location has one or more terminal codes.

These terminals have different Contrado credentials for the desktop app, the API and the web services. The requesting terminal is always linked to these credentials.

Implementation in Qargo

Qargo supports these multiple terminals by using the correct credential set based on the requesting terminal in the shipments.

For shipments that are exported from Qargo, the requesting terminal is calculated based on the gazetteering of the ZIP code of the pickup location (when exporting the delivery) or the delivery location (when exporting the pickup) or the default (when exporting a direct stage).
