Feature releases February 2024

Updated February 20, 2026

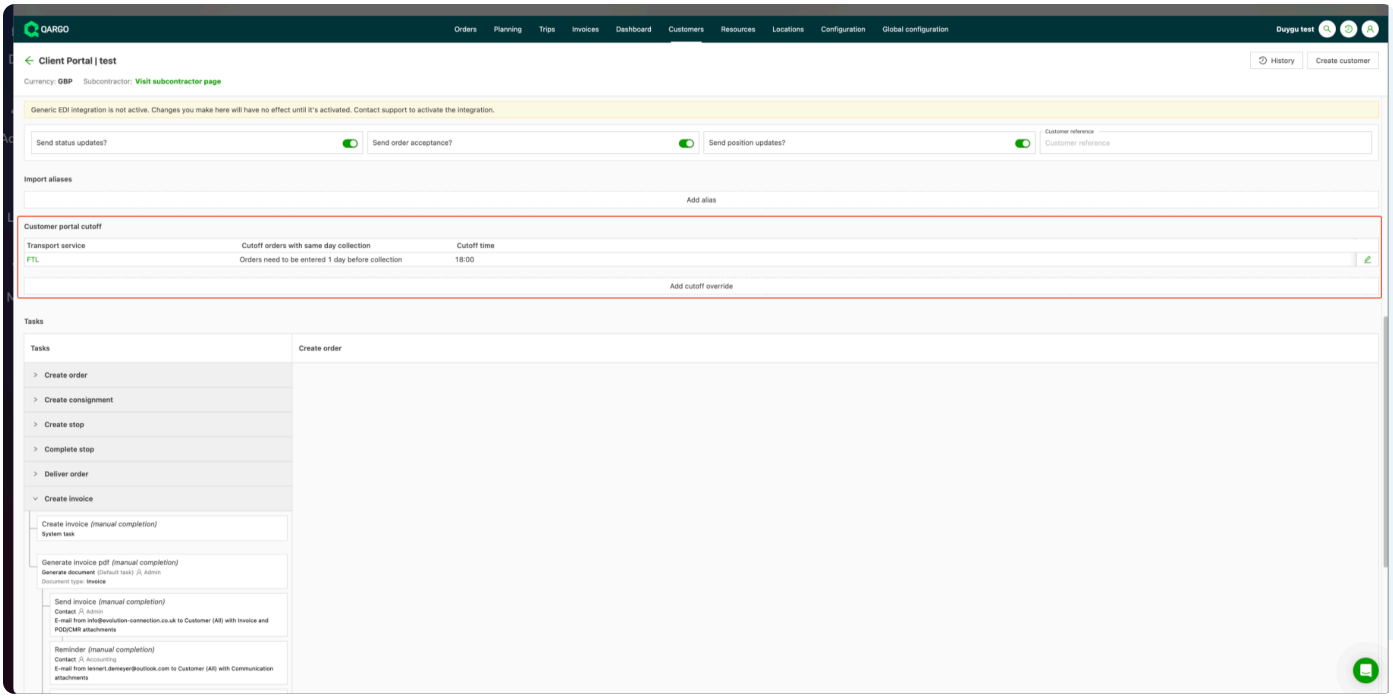

Customer portal cutoff for order capture

Configuration options are now available for adding a cutoff for order capture via the **customer portal.**
In the transportation service settings, the following options can be configured:

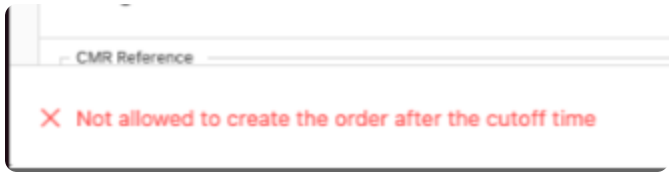

- no cutoff
- a cutoff time for same-day deliveries
- a cutoff time for next-day deliveries

Overrides for this (per transportation service) can be added on the customer detail page.

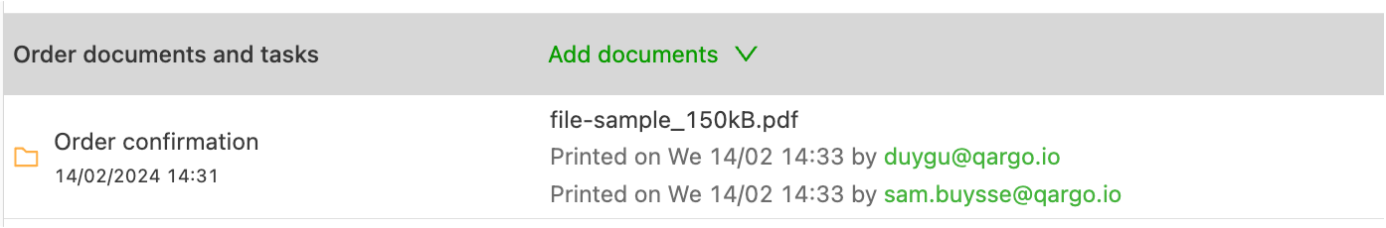

If orders are entered after the cutoff time upon order creation, customers receive an error and the order is not saved:

Track document downloads and prints

Has a document ever been printed or downloaded, only to find that a colleague had already done so?

Now, whenever a document is downloaded or printed, a log is kept next to the document for easy reference.

This makes it easy to avoid duplicate prints and save some trees along the way.

Effortless bulk load document printing

Has printing multiple document types for various loads been a challenge, requiring navigation through each load individually and costing time and efficiency?

No more worrying. Now, click the **Multiple document types** option in the **Print** dropdown menu on the loads page, select the required document types, specify the number of copies, choose the loads, and that's it. All documents are merged into one handy PDF.

No more navigating through individual load records: just seamless printing of documents for multiple loads, all in one go.

Save views on the order page

It was already possible to filter on the order list page. However, switching between different views meant recreating filters each time, which made the task repetitive and time-consuming.

Now, custom views can be created and saved, so filters are always at hand when switching between different views.

In addition, these custom views can easily be shared with other users in the organization, making collaboration a breeze.

Managing orders is now smoother than ever: no more repetitive filtering, just a more streamlined process.
