Feature release June 2025

This article highlights the new features and enhancements released by Qargo this month.

Updated February 20, 2026

Week 1

Orders: AI signature detection on POD / CMRs
Configuration: Configure decimal separator preference
Configuration: Routing default preference
Mobile app: Driver read notification for load confirmation

Week 2

Intermodal: Quick actions update
Orders: Select PDF pages to scan for orders
Orders: Save custom view columns
Orders / Invoices / Loads: Enhanced bulk task processing

Week 4

Loads: Samsara dispatch function available
Intermodal: Improved visibility for booked connections

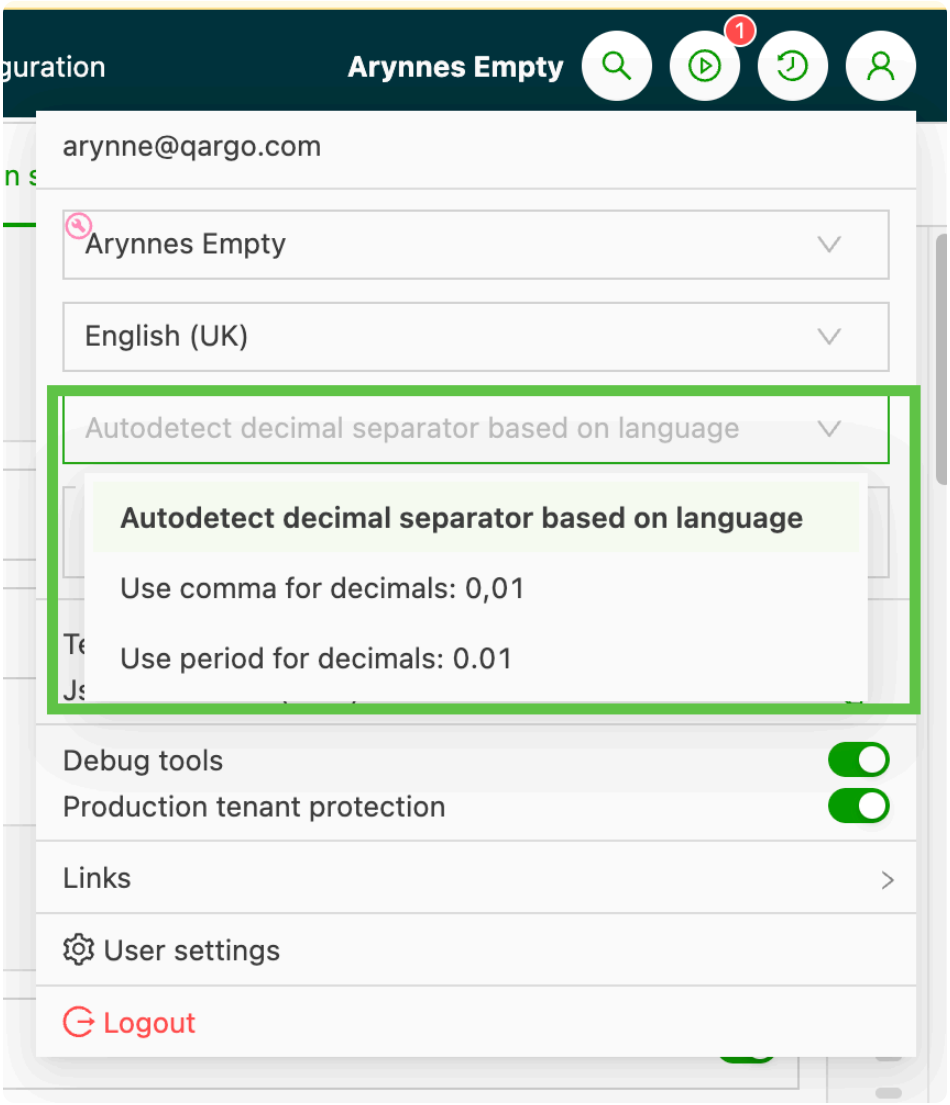

▶ **Week 1**

Configuration: Configure decimal separator preference

Different locations use different decimal separators when entering amounts. Users can now choose which decimal separator to use, to avoid any confusion when generating amounts throughout the system.

There are 3 options available:

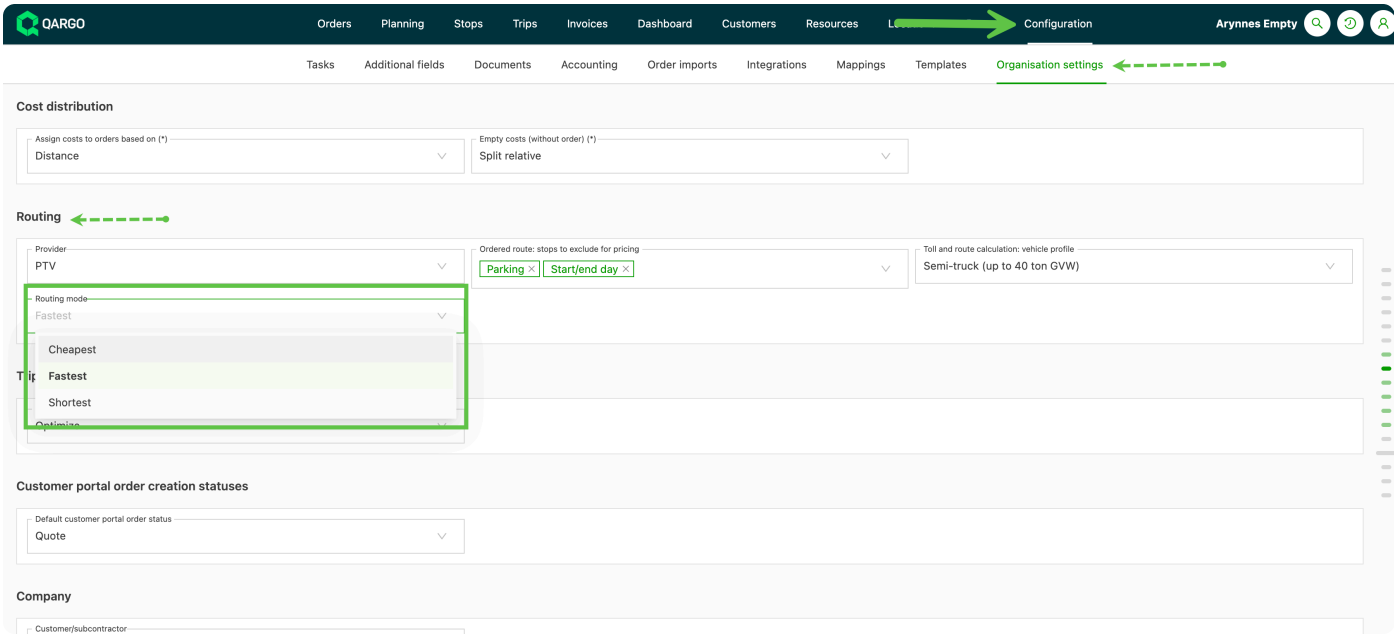

- Autodetect decimal separator based on language (Based on the user's language setting in the tenant.)
- Use comma for decimals: 0,01
- Use period for decimals: 0.01

Configuration: Routing default preference

It is now possible to adjust routing defaults, with 3 options available:

- Cheapest
- Fastest (default)
- Shortest

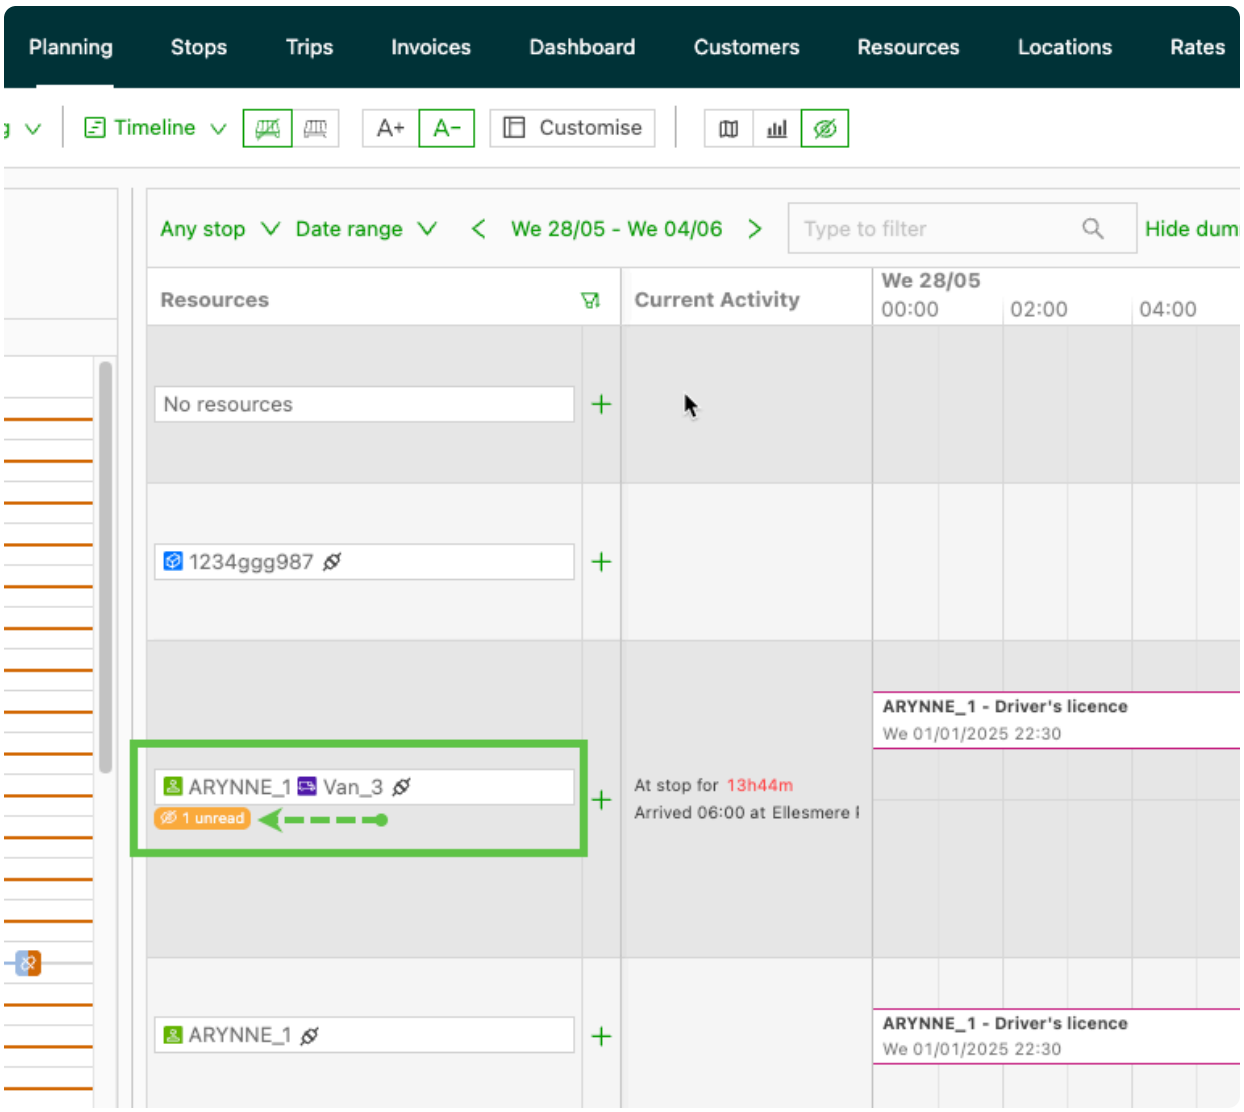

This flexibility allows users to control how their routes and tolls are calculated. This offers more accurate routing and the cost savings that come with it.

> Restricted to users with access to update **Configuration** only.

Mobile app: Driver read notification for load confirmation

No more guessing whether the driver has received the latest load details!

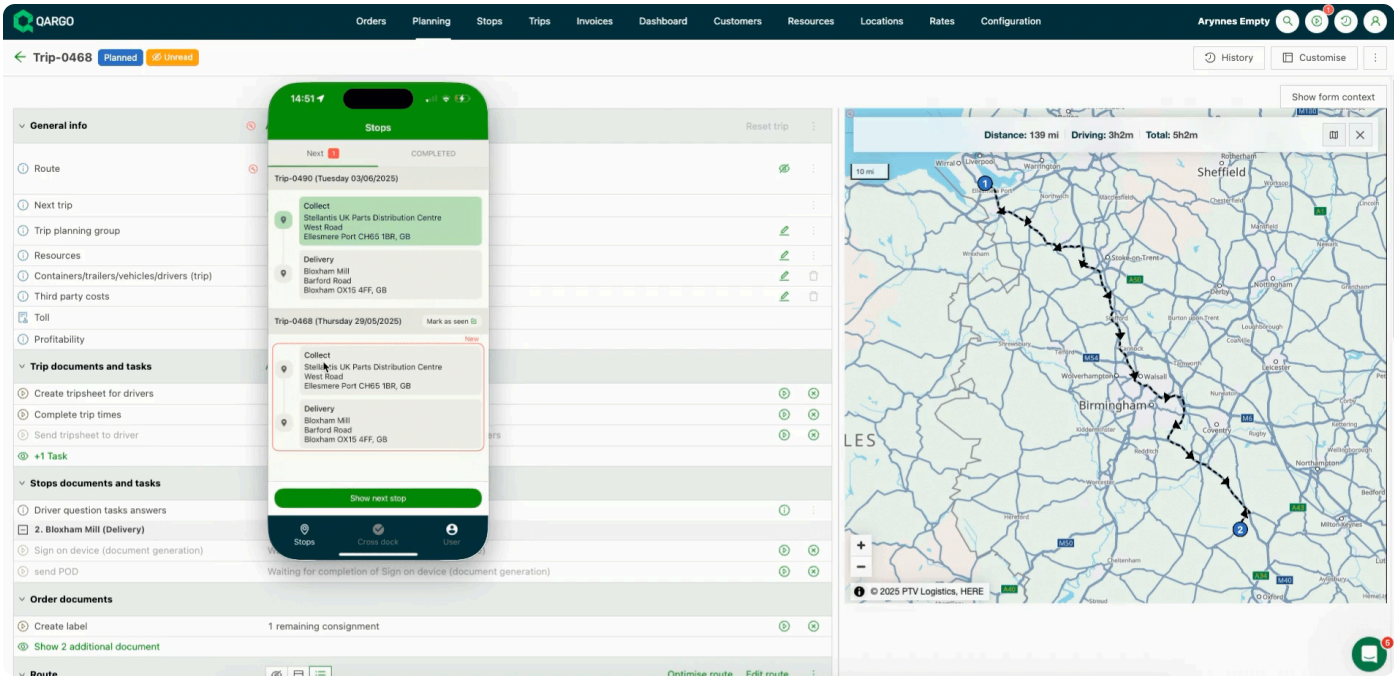

When a load is sent to the driver's mobile device, it now has a label showing ***'Unread'.*** This label shows in the load and on the driver details in the Planning screen.

On the driver side, the driver mobile app shows the details with a red border indicating **New**.

The driver must click to acknowledge the load.

Once the load is acknowledged in the app, the label updates to show ***'Read'*** in the load. The label on the planning board is removed.

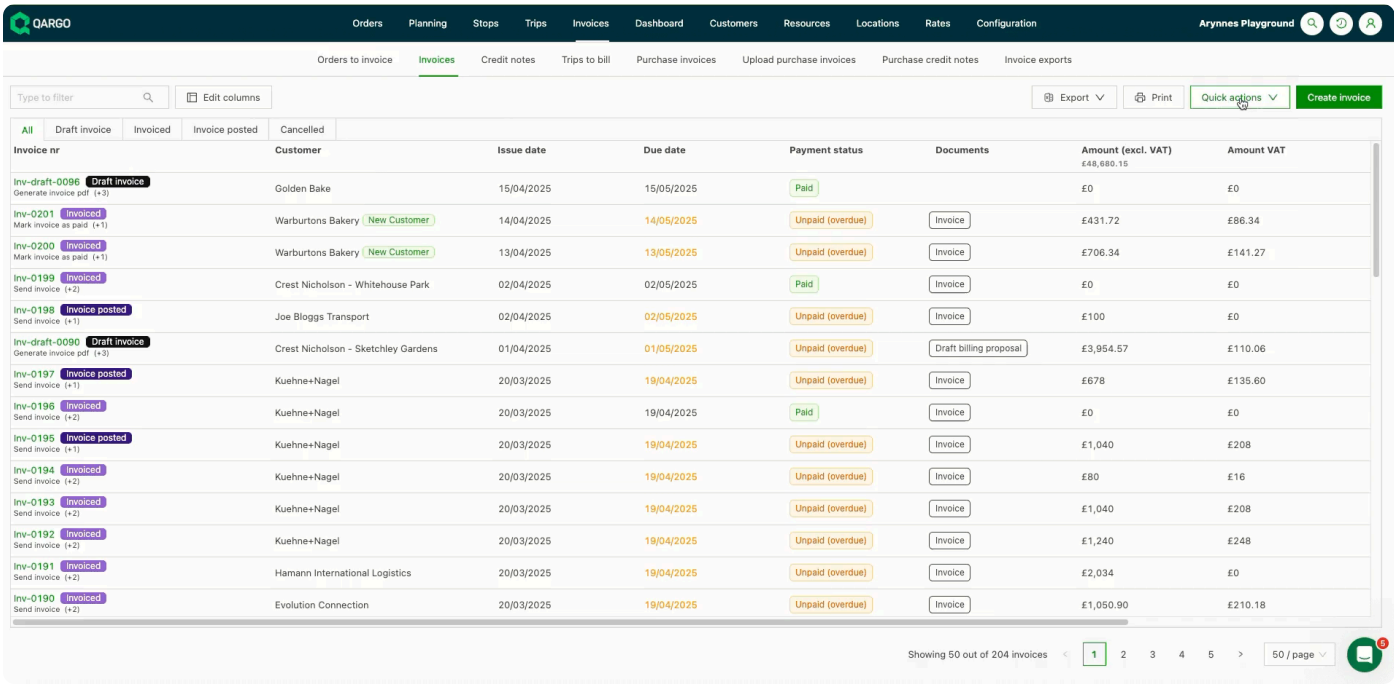

:::

▶ Week 2

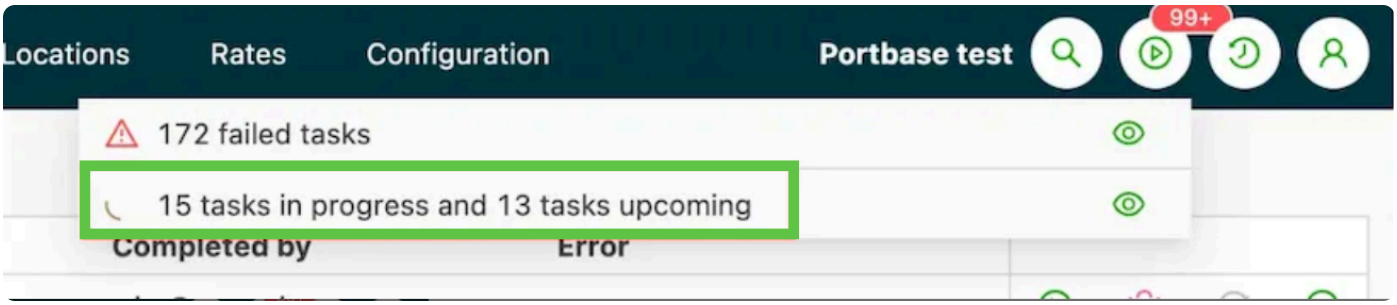

Orders / Invoices / Loads: Enhanced bulk task processing

The previous limit of 100 records for executing tasks in bulk has been lifted; it is now possible to select all records for processing.

- Not all tasks are processed at the same time.
- To distinguish them, tasks show a status of ‘in progress’ or ‘upcoming’. Tasks marked ‘upcoming’ are waiting to be put in progress.
- This happens automatically once the records are selected; no further action is required.

The task indicator displays while the tasks are being updated:

Selecting multiple records is available on the following pages:

- Orders
- Loads
- Invoices
- Carrier invoices
- Credit memos
- Carrier credit memos :::

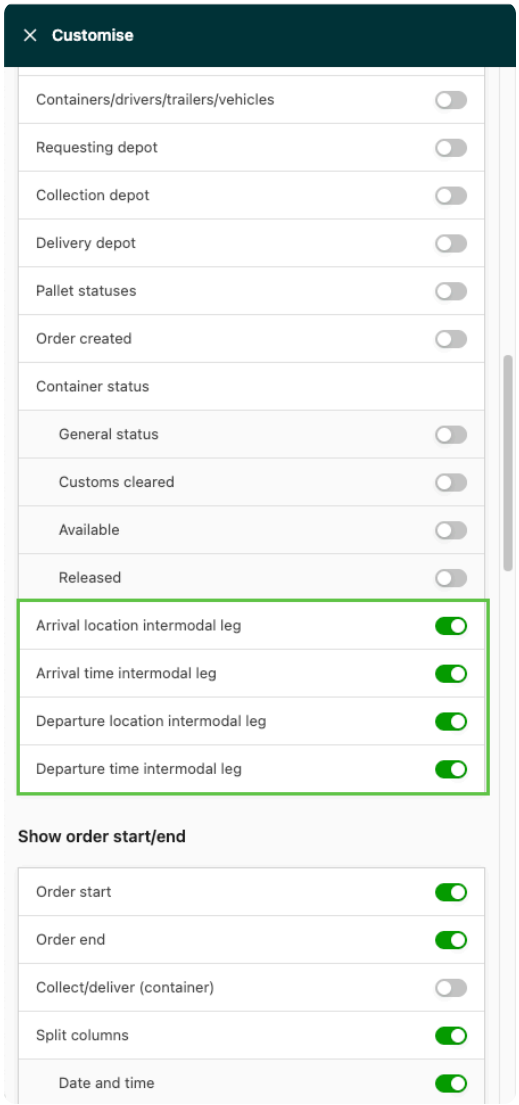

▶ **Week 4**

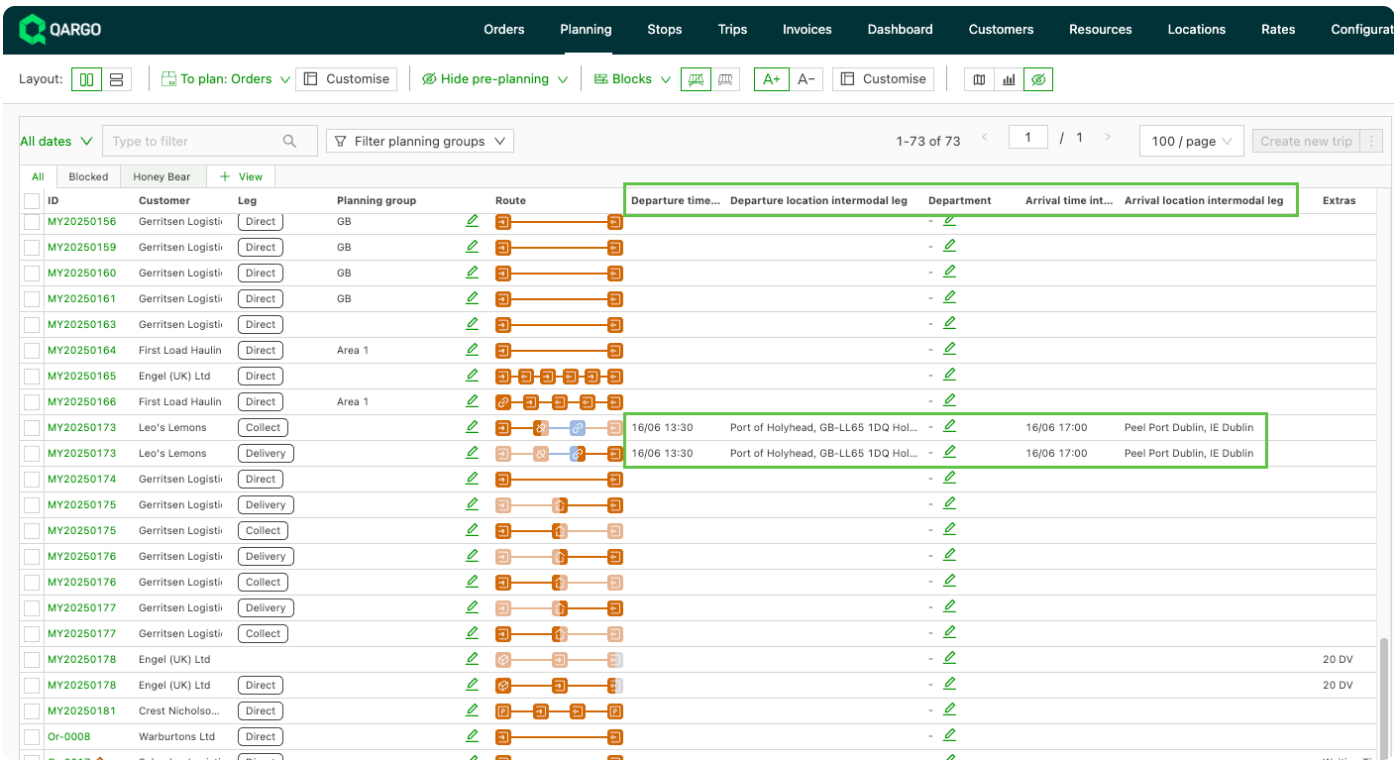

Intermodal: Improved visibility for booked connections

When an intermodal connection was booked, details were previously only visible within the order. Connection details for arriving or departing connections are now also visible in Planning.
Under *To plan: Orders* there are 4 new columns with information on the intermodal arrival and departure locations and dates:

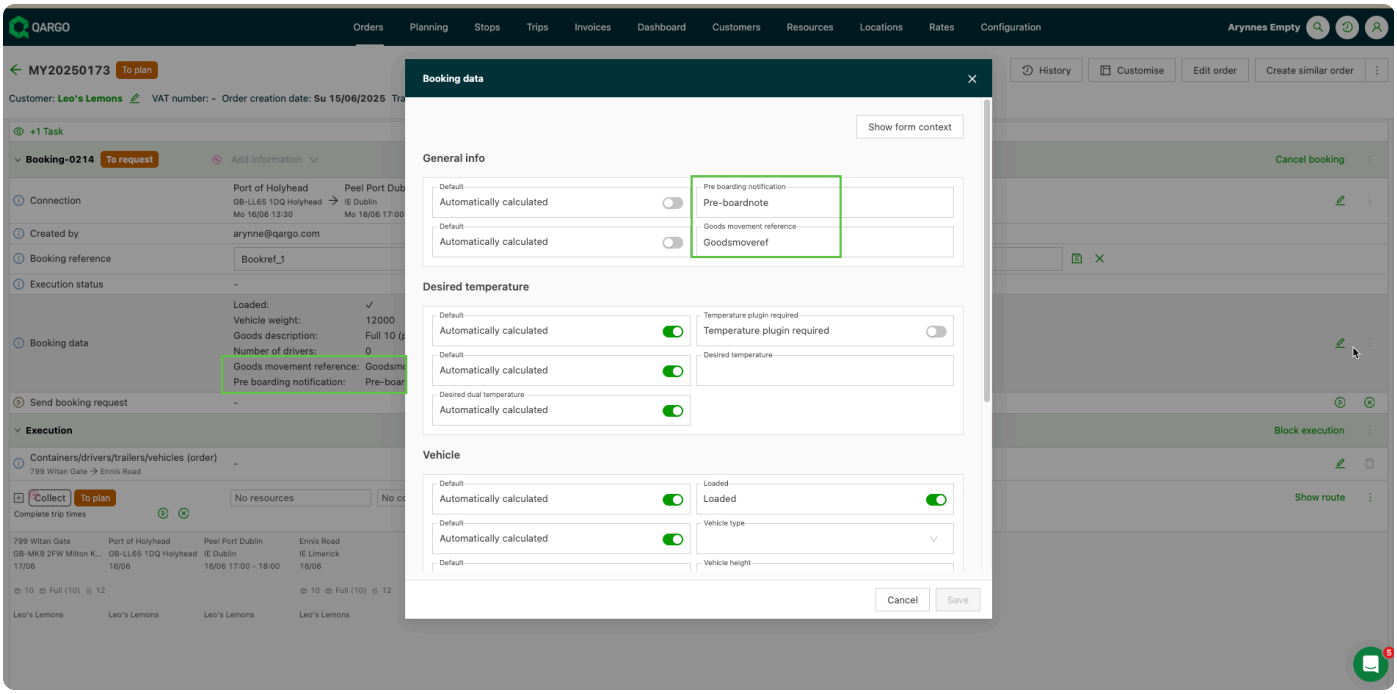

- Departure time intermodal leg
- Departure location intermodal leg
- Arrival time intermodal leg
- Arrival location intermodal leg

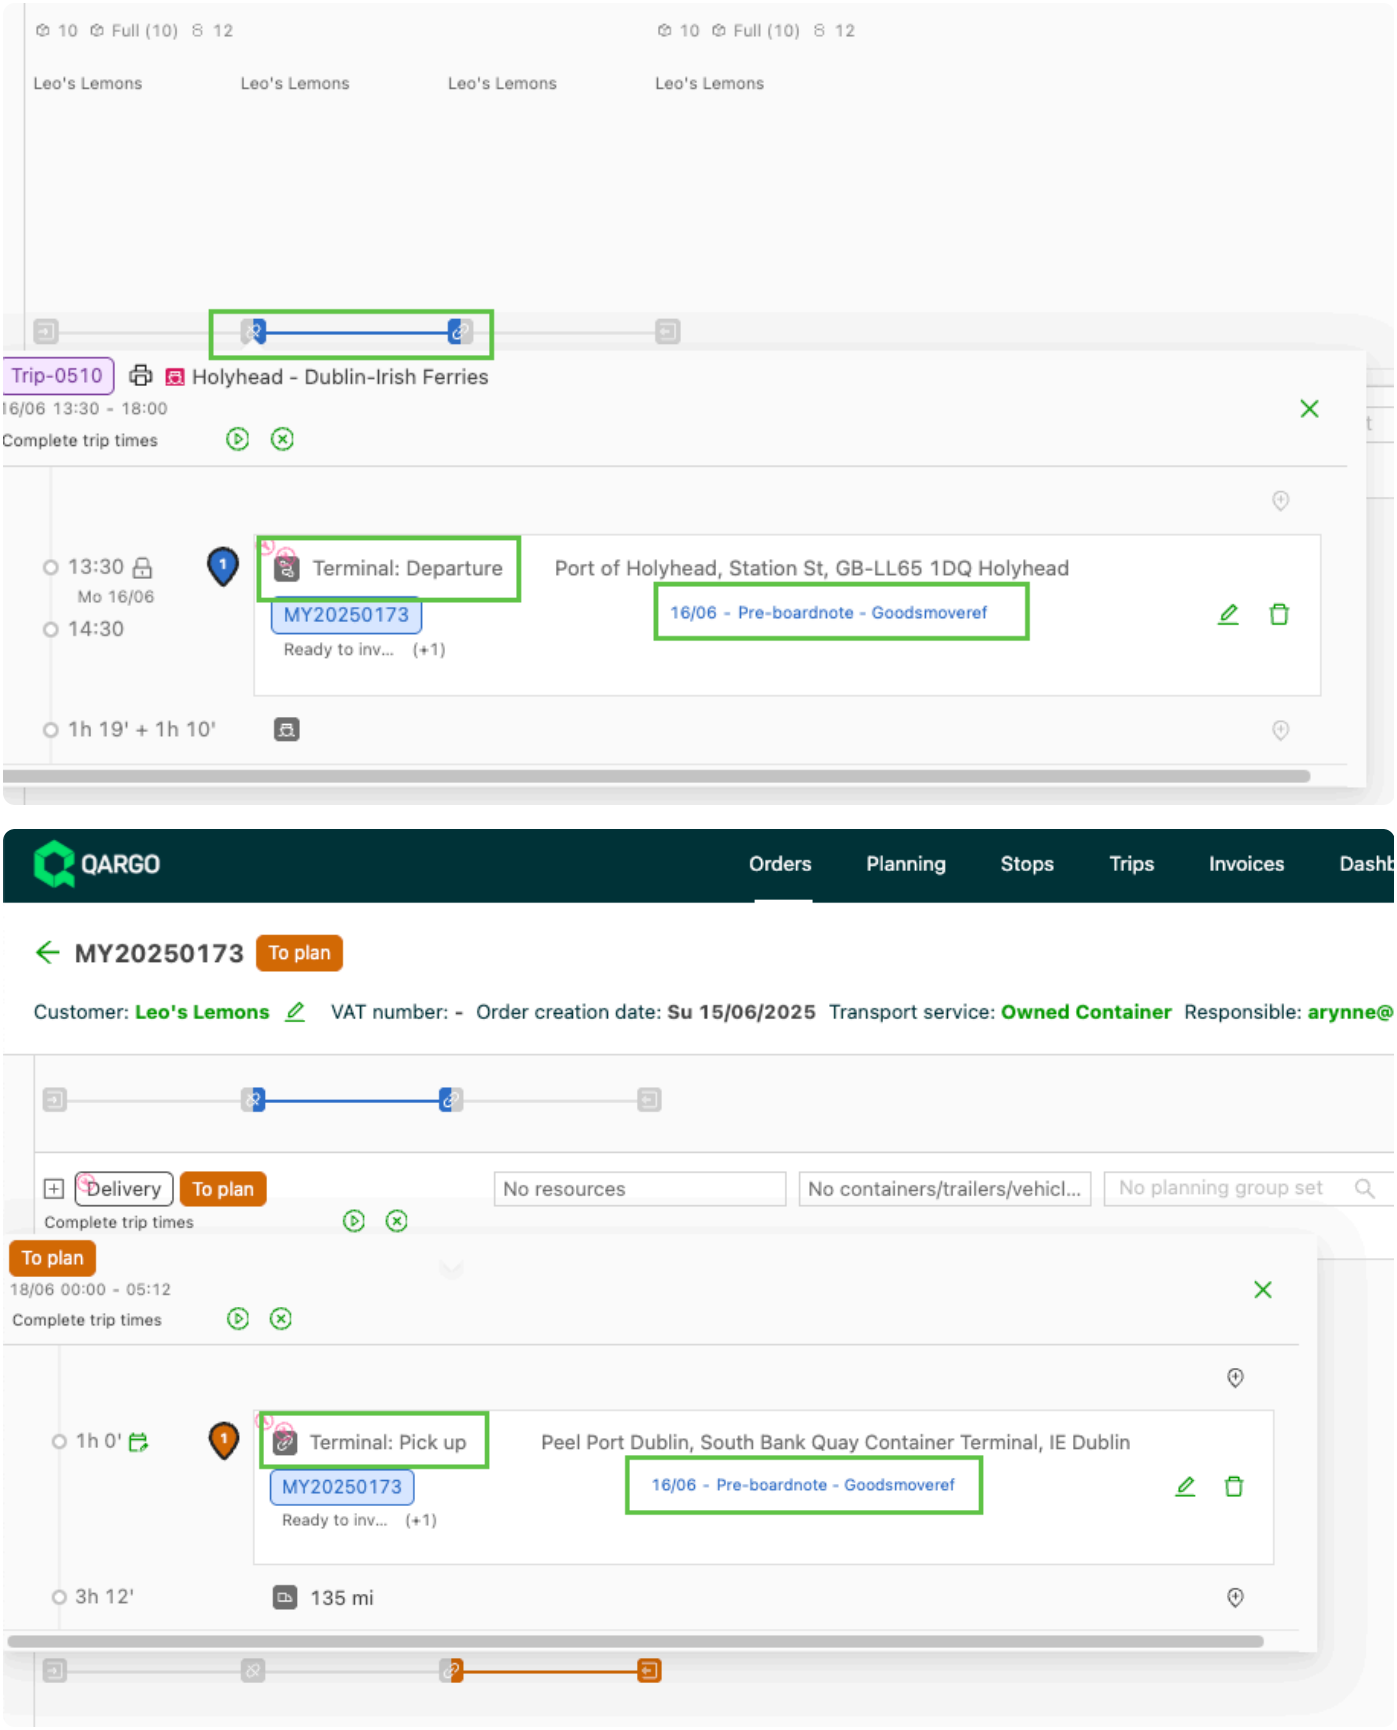

Click ***'Edit columns'*** and toggle them on.

Booking-related references are now also visible on the terminal stop. These can be added to the booking data and show when the terminal stop is expanded.

Customer impact

- Better overview of intermodal information on orders and loads
- Easier planning, with intermodal arrival and departure information readily available :::
