FAQ – Can chargeable weight be used as an exception for splitting revenue on a transportation service?

Qargo supports chargeable weight for transportation service revenue split overrides. This enables accurate shipment rating based on the higher of gross or volumetric weight when configuring split rules.

Updated March 16, 2026

Q. For a company that rates shipments based on chargeable weight, how can accurate revenue splits for orders be configured directly from the transportation service? Distance traveled is used to split revenue, but the chargeable weight metric needs to be taken into account when calculating the revenue. Is this possible in Qargo?

A. Yes! Chargeable weight can now be used as a calculation metric when configuring revenue split override rules on a transportation service.
Chargeable weight can be used in the same way it is already used for revenue calculations at the order level. This makes it possible to configure accurate revenue splits for shipments rated on chargeable weight.

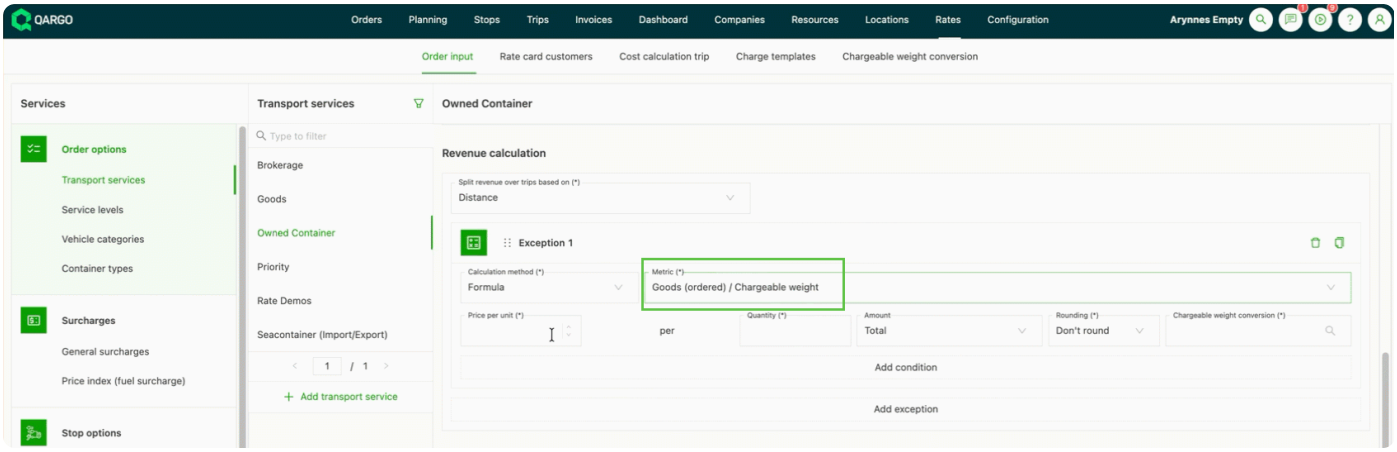

What is chargeable weight?

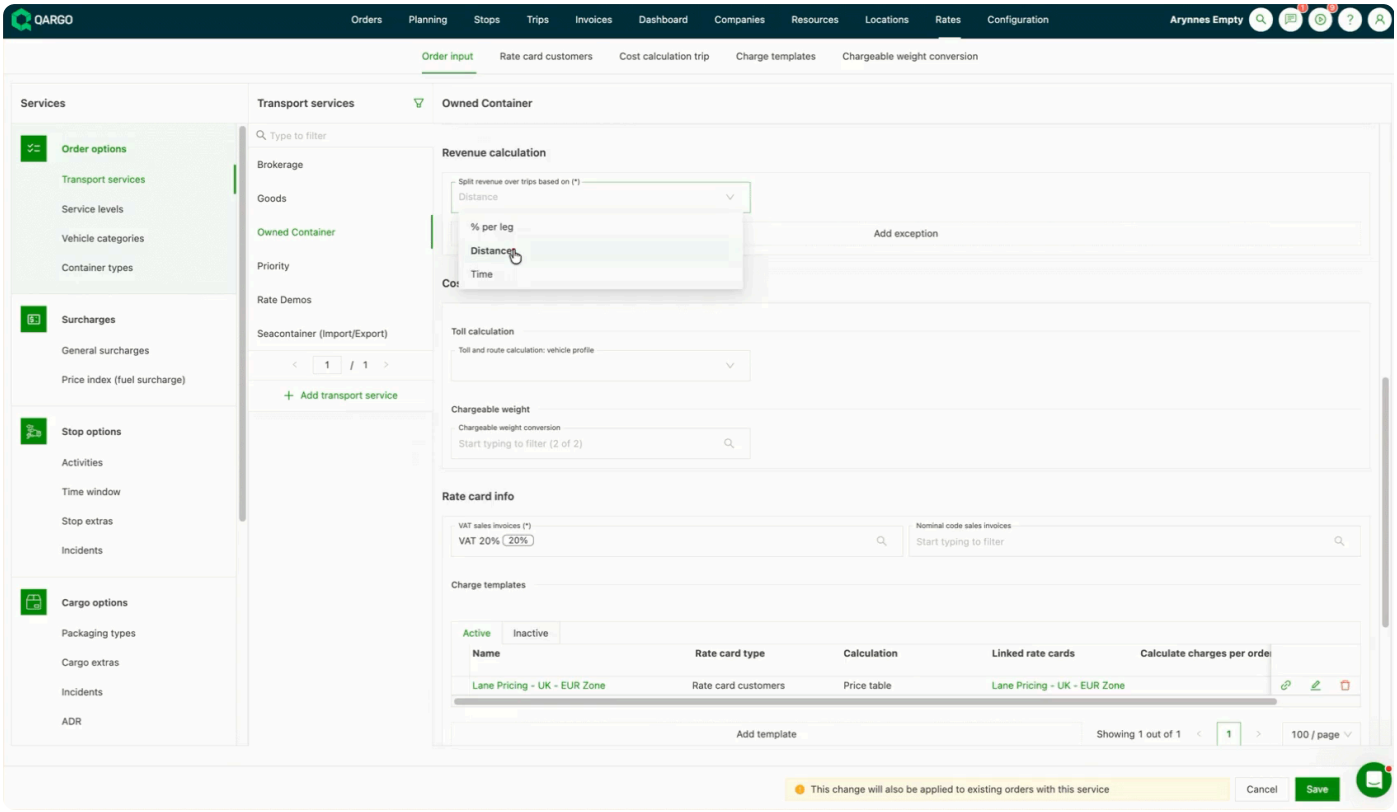

Chargeable weight is the higher value of a shipment's actual (gross) weight and its volumetric (dimensional) weight. Transportation companies that rate shipments based on chargeable weight can now reflect this directly in their revenue split configuration.

> 📚 For more information on how chargeable weight conversions are set up in Qargo, see Chargeable weight conversions.

How to configure a chargeable weight override rule

1. Navigate to **Rates > Order input > Transportation services**.
2. Open the relevant transportation service and scroll to the **Revenue calculation** section.
3. Under **Split revenue over loads based on (*)**, click **+ Add exception** to open the override rule configuration.
4. In the metric dropdown, select **Chargeable weight** as the calculation basis.
5. Configure the override using the preferred method: **fixed amount**, **formula**, or **rate table**.
6. Click **Save** to apply the rule.

📚 Override rules support the same configuration options as the base revenue split: fixed amounts, formulas, and rate tables with chargeable weight as the input.

- Changes to the revenue split configuration on a transportation service are **not applied retroactively** to existing orders. Only new orders, or orders where prices are manually recalculated, will use the updated split rules.
