Video: Per-day resource availability

The To Plan: Resources view has a per-day availability status grid. Each date in the selected planning range has one narrow column, with a single status icon per resource (available, planned, unavailable, rest day).

Updated June 22, 2026

One view, accurate statuses, no manual cross-checking. This video shows how:

❗ To view the column, a **date range** must be specified in the planning board.

As explained in the video, each cell shows a single status icon:

- A **checkmark** means the resource is available, with no loads and no unavailability registered.
- A **dash** means it has a load planned or in progress that day.
- An **'X'** means there's an unavailability, like a training or vacation.
- And **rest day** means the date falls outside the resource's shift schedule. This status only shows if a shift schedule has been configured on the resource.

💡 **When more than one status applies** on the same day, the most important one wins. In this order: unavailable, then planned, then rest day, then available.
