Video: live freight totals on loads

Freight totals (loading meters, weight, volume, pallet spaces, quantity) update live on the planning timeline as orders are added to or removed from a load. As orders are dragged onto or off a load, the totals recalculate immediately.

Updated June 22, 2026

This video shows how freight totals update live in the load timeline:

▶ https://watchclueso.com/embed/tiqge4y4k399bmiv

🔎 **Customize** each planning view (A+/A−) to keep freight visibility consistent when switching between showing more or less data in the load block.

Other things to keep in mind when configuring:

1. **Rows not visible?** Open the **Customize** icon (top right of the timeline) and turn on at least one of the three freight views. None are enabled by default.
2. **Totals not updating?** Check that the relevant metrics (LDM, weight, pallet spaces) are actually filled in on the order. Rows only reflect values that exist on the orders. They don't assume or apply defaults.
3. **Freight per leg type stays empty?** This view requires pallet space values on the order (half/full pallets). Orders with only LDM or weight won't populate it.
4. **Rows disappear after zooming?** The A+/A− zoom buttons affect row visibility. Configure the preferred views in **Customize** once, then keep a consistent zoom level while planning.
5. **The three views are independent.** Any combination can be enabled at the same time. There is no need to pick just one.
