Video - How to auto-assign orders to an existing matching load?

Load resource assignment rules can now add a new order to a load an earlier order already created, instead of always creating one load per order. On top of that, load templates give the matched load a fixed stop sequence.

Updated November 9, 2026

This video explains how to set up auto-assign rules and how this works in practice:

📚 A few things to know about load matching:

- Matching only happens when an order is created, so loads made by hand, or before the rule was switched on, are never joined. There's no capacity check, so a load keeps taking orders however big it gets.
- And once a load is dispatched or in progress, it stops accepting orders. Those orders stay in To plan for a planner to handle.
